F SERIES
Mechanical Injection System

INDUSTRIAL ENGINES
INTRODUCTION

We would like to thank you for buying an FPT product, and compliment you on your choice of engine. Before you carry out any operation involving the engine or its fittings, please read the contents of this manual carefully; compliance with the instructions provided in the manual is the best way to guarantee trouble-free, long term operation of the engine.

The contents of this manual refer to the standard configuration of the engine, and the illustrations are purely indicative. Some instructions are provided by giving the sequence of operations to be carried out in order to allow the engine and/or its fittings to perform in a certain way. In some cases they will be dependent on the configuration of the commands and the set-up of the machine on which the engine is installed; for any points that differ from the contents of this manual, please consult the instructions provided by the machine Manufacturer or a specific manual.

The information provided below was current at the date of publication. The Manufacturer reserves the right to make modifications at any time without prior notice, for technical or commercial reasons or to update the engines to comply with legal requirements in the various Countries. The Manufacturer declines all liability for any errors or omissions.

Please remember that the FPT Technical Service Network is available to offer you its experience and professional skills, wherever you may be.

GENERAL INFORMATION

GUARANTEE
In order to ensure that your engine gives the best possible performance and to take advantage of the FPT guarantee, you must follow the indications provided in this publication with great care; failure to do so may result in invalidation of the guarantee.

SPARE PARTS
Always use Original FPT Spare parts. This is essential to keep the engine in original running order. The use of non-original spare parts will not only invalidate the guarantee, but will mean that FPT will not be considered liable in any way during the whole working life of the engine.

LIABILITY
The Manufacturer will only be considered liable subject to performance of the control and maintenance operations indicated and described in this manual; to this effect, proof that these operations have been performed must be provided. Any special maintenance operations that may be necessary must be carried out by qualified technicians from Workshops in the FPT Network, using the instruments and equipment provided for the purpose.

SAFETY
The following information is intended to encourage caution when using the engine, so as to avoid damage to persons or property as a result of improper or incorrect behaviour.

- The engines must only be used for the purposes indicated by the Manufacturer.
- Any tampering, modification and use of non-original spare parts may compromise proper operation and safe use of the engine; **never, under any circumstances** make modifications to the wiring and to the units equipping the engine, or connect them to other power systems.
- Pay particular attention to moving parts of the engine, to high temperature components and to circuits containing pressurised fluids; its electrical equipment houses electrical currents and voltage.
- The exhaust fumes produced by the engine are bad for your health.
- The engine must be handled using suitable lifting tackle, making use of the U-bolts provided on the engine for that purpose.
- The engine must not be started up and used until the machine in which it installed has satisfied all necessary safety requirements, or until the machine has been guaranteed to comply with local laws and regulations.
- The operations required to guarantee the best possible use and preservation of the engine must only be carried out by persons of proven experience, equipment with tools considered suitable by FPT.

For the purpose of safety, further recommendations are given in the chapter CONTROLS AND MAINTENANCE.
ENGINE TECHNICAL DATA F32 MNS

The technical code and serial number are indicated on a plate, which is located on different parts of the engine, according to the model: flywheel casing, tappet cover, other.

### WARNING

Any alteration of the above mentioned characteristics is strictly prohibited, penalty invalidation of the guarantee and absence of all liability on the part of FPT.
**F32 MNS (55 kW) / F32 MNT (65 kW)**

**F32 MNS (55 kW) / F32 MNT (65 kW)**

**SIGNS**

Certain warning signs are affixed to the engine by the Manufacturer, and their meanings are indicated below.

**N.B.** The signs with an exclamation mark on them underline a potential danger.

- **Lifting point (engine only).**
- **Fuel Cap (on the fuel tank, if there is one).**
- **Oil Cap.**
- **Oil dipstick.**

**Danger of burning:**
Expulsion of hot water under pressure.

**Danger of burning:**
Presence of high temperature parts.

**Danger of fire:**
Fuel present.

**Danger of impact or catching on moving parts:**
Presence of fans, pulleys, belts or the like.
USE

PRELIMINARY CHECKS
Before starting the engine each time:
- Check the level of technical fluids (fuel, engine oil and coolant), and top-up if necessary.
- Make sure that the exhaust gas system is efficient and that the intake air filter/s is not clogged.
- Make sure that the start batteries are efficient and that heir clamps are correctly connected.

Note: The maintenance procedures are reported in the CONTROLS AND MAINTENANCE section.

STARTING AND STOPPING THE ENGINE
The start-up and shut-down operations described below apply to an on-board control panel manufactured by FPT; if the Manufacturer of the vehicle or machine has fitted a customised instrument panel, these operations may vary according to the various choices made during construction.
In these cases, follow the start-up/shut-down sequences and use the instrument panel description provided in the specific documentation.

WARNING
In case it is necessary to top up the engine cooling liquid with a considerable quantity of coolant, follow the specific procedure reported in the herein SPECIAL WARNINGS section.
Starting the engine from the FPT control panel (supplied on demand)

1. Insert the key into the switch (1) and turn it to the right to position 1B. “Run”. Once the indicator lights have been tested and the beeper has stopped sounding, make sure that the analogue instruments are showing values that conform with the relevant physical parameters of temperature, battery voltage and oil pressure; (information on how to interpret the indicators and alarms is given in the relevant paragraph).

2. If the engine is fitted with a pre-heating system (optional) and the engine temperature is lower than the minimum value foreseen for it to come into operation, wait for the relevant indicator light to go out.

3. Turn the key to position 1C “Start” and release it once the engine has started, without accelerating.

4. Make sure that the “Battery recharge” and “Oil pressure low” indicators have turned off and that the analogue instruments are showing values that conform with the relevant new physical parameters. If the pre-heating system has intervened, the relevant indicator will turn on again to indicate that the post-heating phase is in progress; the duration of this function is proportional to the temperature value.

5. If the engine does not start, after releasing the key it will only be possible to turn it back to the start position after first returning the switch to the rest position 1A.

1A “REST” position allowing the key to be removed
1B Stable “RUN” position
1C Unstable “START” position
STOP Unstable position used in EXCITED STOP set-ups for engines fuelled by a mechanical injection pump.
Stopping the engine from the FPT control panel

Before stopping the engine it is recommended you run it for a few minutes at minimum speed with no load; this will allow the temperature to drop evenly and will avoid harmful thermal shocks.

The shutdown method will depend on the type of equipment installed.

**With “unexcited” stop circuit**
- Turn the key switch to position **1A** - REST.

**With “excited” stop circuit**
- Turn the key switch to the **STOP** position.

In the absence of FPT control panels, always follow the instructions provided by the Manufacturer of the machine.

Should you intend to re-start the engine:
1. Return the key switch to the rest position **1A**, thus resetting all the on-board panel functions (Required for electronically controlled engines).
2. Turn the key to position **1C** “Start” and release it once the engine has started, without accelerating.
3. Proceed as described previously.

**RECOGNISING ALARMS**

**Indicator and alarm synoptics**

The FPT instrument panel contains the indicator lights used to indicate the state of operation of the engine. Light-up of these indicators is piloted by electronic circuits, which have a simultaneous alarm timer and storage function.

- **7A.** Maximum allowed rotation speed exceeded (on request)
- **7B.** Air filter blocked
- **7C.** Fuel level low
- **7D.** Coolant temperature high
- **7E.** Oil pressure low
- **7F.** Alternator malfunction
- **7G.** Engine coolant level low
- **7H.** Pre-post heating

Some types of engine and relevant equipment only make some of the functions indicated in the key available.

If the machine Manufacturer uses different technical options there may also be further changes to the above.
**Operation**

When the key is turned in the switch to position **1B** an efficiency test is performed, for 5 seconds, on all the indicator lights, with the exception of the “Pre-post heating” indicator, while at the same time the beeper sounds.

During start-up and for the following 15 seconds, all synoptic functions are disabled; after this period, each critical state detected by the sensors provided on the engine will result in the relevant indicator lighting up.

Some alarms, which are of critical importance for efficient running of the engine, will not only light the relevant optical indicator, but will also start the beeper and cause automatic shutdown of the engine:

- Maximum allowed rotation speed exceeded
- Coolant temperature high
- Oil pressure low
- Engine coolant level low.

---

**CAUTION!**

In the event of momentary stoppages of the engine, pay attention to the synoptics and check for any alarm signals. Do not restart the engine until the cause of the problem has been removed or proper operating conditions have been restored.
FOR PROPER USE OF THE ENGINE

- Before starting the engine, check there is enough fuel in the fuel tank.
- Do not keep on starting.
- Do not keep the engine idling for a long while since this has negative effects to the engine performance.
- Actual power values must comply with the rated values reported in the technical documentation.
- When operating the engine, regularly check that:
  - the cooling liquid temperature does not exceed the threshold value;
  - the oil pressure keeps within normal values;
- Particular attention must be drawn on emergency power unit engines, which must be submitted to frequent overhauls in order to ensure their prompt start whenever required.

SPECIAL WARNINGS

Engine cooling liquid

When the engine is running, regularly check that the engine cooling liquid temperature does not reach the alarm threshold. In case the temperature detected is excessive, disconnect the load and stop the engine to check the cooling circuit status. Wait that the engine is cold before checking: it is important to remind that, when the engine is heated, the pressurized hot liquid within the cooling circuits may be ejected causing burns and serious injury.

Moreover, check the following:
- a) the alternator’s belt tension;
- b) the thermostatic valve’s efficiency;
- c) the conditions of the heat exchanger (to be cleaned if necessary).

CAUTION!

Open the cooling liquid tank cap only if it is necessary and exclusively if the engine is cold.

Cooling liquid refill

For engine servicing and whenever the system requires significant cooling liquid refill, proceed as follows:
- Refill the engine and the heat exchanger until complete top up.
With the filler cap open, start the engine and keep it idling for nearly one minute. This phase facilitates the cooling liquid air bleed.

Stop the engine and top up again.

Further information on the cooling liquid technical specifications and quantity prescribed are reported in the CONTROLS AND MAINTENANCE section.

**CAUTION!**

Failure to comply with the procedure may cause the incorrect engine cooling liquid refill and, as a consequence, wrong quantity within the engine.

**Fuel circuit**

Avoid using the engine with only a small reserve of fuel in the fuel tank; this encourages the formation of condensation and makes it more likely you will suck up dirt or air, resulting in engine stoppage.

**CAUTION!**

When refuelling, always pay great care to ensure that no solid or liquid pollutants enter the fuel tank; you must also remember that smoking and live flames are prohibited when refuelling.

**CAUTION!**

Never loosen the circuit connectors in any way when the engine is running.

**Lubrication circuit**

Regularly check that the oil pressure keeps within normal values. In case the value detected is too low, check the oil level and refill if necessary following the instructions reported in CONTROLS AND MAINTENANCE section.

If the failure persists, apply to the Technical Service for assistance.
Air intake and exhaust discharge circuits
Inspect the cleanliness of the air intake circuit on a regular basis. The maintenance intervals indicated in this manual vary according to the conditions in which the engine is used.
In particularly dusty environments it is necessary to carry out maintenance at more frequent intervals; with respect to the indications provided in the chapter CONTROLS AND MAINTENANCE.

**CAUTION!**
Visually check that the exhaust circuit is not blocked or damaged, so as to prevent dangerous fumes.

Electrical recharging and start-up system
Periodically check, particularly during the winter, to ensure that the batteries are clean and in full working order, checking and topping up as indicated in the chapter CONTROLS AND MAINTENANCE.
Should it be necessary to replace the batteries, always respect the capacity and minimum discharge current intensity requirements.

**WARNING**
Contact a specialised workshop and check battery and recharging system efficiency if the voltmeter indicates a voltage below 11 V (for 12 V rated systems), or 22 V (for 24 V rated systems).

**CAUTION!**
The batteries contain an acid solution that will burn the skin and corrode clothing; when checking them, always wear protective clothing, gloves and goggles, do not smoke or use live flames in the vicinity, and make sure that the room they are housed in is adequately ventilated.

Periodically check or have someone check the cleanliness, wear and full tensioning of the drive belt.

**RUNNING IN**
Thanks to modern engine construction technology, no particular running in procedure is required. However, it is recommended that, for the first 50 hours, you do not use the engine at high power for long periods.
CONTROLS AND MAINTENANCE

MAINTENANCE PERSONNEL

The engine control and maintenance operations described in the following chapter require training, experience and compliance with current safety regulations; for this reason they must be carried out by special technicians, as indicated below.

- **Controls**: by workshop technicians or the machine user if necessary.
- **Periodic maintenance**: by qualified personnel using suitable equipment and adequate means of protection.
- **Special maintenance**: by qualified personnel from Authorised Service Centres who have detailed technical information and specific equipment.

The most qualified Assistance Centres are those which make up the FPT Technical Assistance Network.

ACCIDENT PREVENTION

- Always wear heavy-duty footwear and overalls.
- Never wear loose, flapping garments, rings, bracelets and/or necklaces in the vicinity of engines or moving parts.
- Always wear protective gloves and goggles when:
  - filling up batteries with acid solution
  - refuelling with inhibitors or antifreeze
  - replacing or topping up lubricant (hot engine oil may cause burns and scalds. Only carry out these operations when the oil has dropped to a temperature of below 50°C).
- When working in the engine compartment, pay particular attention to how you move, to avoid contact with moving parts or high temperature components.
- Wear goggles and use high pressure air jets (maximum air pressure used to clean is 200 kPa (2 bar, 30 psi, 2 kg/cm²).
- Wear a protective helmet when working in an area were there are suspended loads or systems installed at head-height.
- Use protective hand creams.
- Immediately replace wet overalls.
- Always keep the engine clean, removing oil, grease and coolant stains.
- Store cloths in flame-proof containers.
- Do not leave foreign bodies on the engine.
- Use suitable, safe containers for used oil.
- When completing a repair, make suitable provisions to stop the engine taking in air if, after start-up, an uncontrolled increase in engine speed were to occur.
**REQUIREMENTS**

1. Do not disconnect the batteries with the engine running.
2. Do not carry out arc welding operations in the vicinity of the engine without first removing electrical cables.
3. After each maintenance operation involving disconnection of the battery/batteries, make sure that the terminals have been properly locked onto the poles.
4. Do not use battery chargers to start the engine.
5. Disconnect the on-board network battery/batteries when recharging.
6. Do not paint the appliances, components and electrical connectors equipping the engine.
7. Disconnect the battery/batteries before any electrical operations.
8. Contact the Manufacturer before installing electronic equipment on board (two-way radios and the like).

**CAUTION!**

Do not carry out maintenance operations when the electric power supply is turned on: always check to ensure that the appliances are properly earthed. During diagnosis and maintenance operations, make sure that your hands and feet are dry, and whenever possible use insulating stands.

**CAUTION!**

The conditions provoking the emergency power unit start may suddenly occur. Whenever executing checks and maintenance operations, strictly follow the safety instructions prescribed by the unit’s Manufacturer and power unit system’s outfitter to operate safely and prevent injury.

**WARNING**

Do not execute any operation which may change the ignition pump’s calibration.

The ignition pump’s calibration has been carried out in phase of engine system test based on its final use or destination.
REFUELLING

<table>

</tr>
</tbody>
</table>

(*) The amounts indicated relate to the standard configuration of the engine only.
(1) Use a mixture of water and 50% PARAFLU 11 even during the summer months. As an alternative to PARAFLU 11, use another product that complies with international specifications SAE J 1034.
(2) Use lubricants that comply with international specifications ACEA E3 - E5 (high power engines), API CF - CH4 (associated with fuels with a percentage sulphur < 0.5%), MIL - L - 2104 F.
   The viscosity level of oil to be used depending on surrounding temperatures in given in the table provided in the appendix.
   Oil consumption is considered acceptable when it reaches a maximum of 0.5% of fuel consumption
(3) The amounts indicated refer to initial refuelling, and include filling the engine, sump and filter.
(4) Use STANDARD fuel compliant to the EN 590 (2005/55 - 2005/78). The use of additives is discouraged. A fuel known as BIO DIESEL is allowed only if it is compliant with the EN EN 14214 - ASTM 6751 norm, mixed in standard fuel with a maximum percentage of 20%.
   Contact the FPT commercial network if KEROSENE-based fuel known as XF63, F63, F34, F35, JP8 are to be used.
   Only the use of mixtures containing suspension water is permitted, as indicated in the CUNA NC 637-01 (GECAM) and AFNORM 5-02 (AQUAZOLE) norms, in a maximum percentage of 12% and by using special additives. A 12% performance reduction is foreseen.

WARNING

Refuelling from drums or tanks may result in pollution of the diesel fuel, with the risk of damage to the injection system; if necessary, filter the fuel in a suitable manner or allow sedimentation of the impurities before refuelling.

Low temperature diesel

EN590 specifications distinguish different classes of diesel fuel, identifying the characteristics of those best suited to low temperatures. It is entirely up to the Oil companies to comply with these regulations, which foresee that fuels suited to the climatic and geographic conditions of the various Countries be distributed.
**FREQUENCY**

The maintenance intervals indicated below take into account the typical working factors for various types of engine use; the most suitable interval for maintenance operations for the various applications will be indicated by the maintenance staff, according to the way and working conditions in which the engine is used.

</table>
1) Maximum period when using good quality fuel, (EN 590 standard); this is reduced if the fuel is contaminated and alarms are triggered due to blockage of the filters and presence of water in the pre-filter. When blockage of the filter is indicated, it must be replaced. If the water in pre-filter indicator does not go out after drainage, the pre-filter must be replaced.

2) Refers to engines with traditional and automatic tensioning devices

3) Must be performed annually, even if the required number of working hours are not reached

4) Replace lubricants according to the frequency indicated in the REFUELLING table.

5) Only use filters with the following characteristics:
   - filtration level < 12 μm
   - filtering efficiency β > 200.

6) The frequency with which operations are carried out will depend on the working conditions and efficiency/wear of the product.

7) Required by oil vapour recirculation.

**HOW TO PROCEED**

**Check oil level in engine**

Only proceed with the engine stopped and at a low temperature, so as to avoid the risk of burning.

- Take all necessary action to ensure that the machine is “level”.
- Using the dipstick (1), check that the oil level is between the "Min" and "Max" levels.
- If the level is too low, top up through the inlet, after first removing the relevant cap (2).

---

**WARNING**

The extraordinary maintenance operations described hereunder fall within the exclusive competence of manufacturer’s personnel or specialised personnel having proper working tools and adequate protection devices. The procedure and modality for carrying out these operations are illustrated in the FPT Technical and Repair Manual.
**Check coolant level**

Proceed only with engine not running and at low temperature to avoid any risk of burns.

- With the engine cold, make sure that the level of liquid inside the heat exchanger is sufficient to cover the heat exchanger elements.
- Top up the tank if necessary, using clean water. Do not use distilled water; see the table REFUELLING.

**Note:** If the refill operations occur frequently a diagnosis of the cooling circuit is necessary.

In the event that only the heat exchanger without the expansion tank is available on the vehicle, refill it if necessary, paying attention that the fluid does not saturate the internal volume of the exchanger in order to enable any increase in volume of the fluid caused by the temperature increase.

**WARNINGS**

- After topping up, make sure that the oil level does not exceed the "Max" limit marked on the dipstick.
- Make sure that the dipstick is inserted properly and the filler cap is turned in a clockwise direction until it stops turning completely.

**CAUTION!**

When the engine is warm, a pressure liable to cause hot liquid to be expelled with extreme violence is created within the cooling circuits. This results in a danger of burning.
Clean heat exchangers
Check that the radiator air inlets are free from dirt (dust, mud, straw, etc.).
Clean them if necessary, using compressed air or steam.

Cleaning the air filter
Only proceed with the engine stopped.
- If necessary, remove the rear manoeuvring hook (1).
- Remove the filter cover (4) after first freeing the two snap hooks (3).
- Extract the main cartridge (2). During this operation, take care to ensure that no dust gets into the sleeve.
- Check that there is no dirt. If there is, clean the filter element as indicated below.
- Blow dry compressed air through the filter element, from the inside outward (maximum pressure 200 kPa). Do not use detergents; do not use diesel.
- Never use tools to beat the filter element, and check its condition before replacing it.
- Replace the filter if any breakages or tears are found.
- Check that the gasket at its base is in good condition.
- Reassemble by repeating the above operations in reverse order.
- If the rear manoeuvring hook (1) has been removed, fix it to the flywheel cover casing by tightening the fixing screws to a torque of 70±7 Nm.

CAUTION!
The use of compressed air makes it necessary to use suitable protective equipment for the hands, face and eyes. Please see the prescriptions in the paragraph on ACCIDENT PREVENTION.
Drain water from the fuel pre-filter and fuel filter

The high risk of refuelling with fuel that is polluted by foreign bodies and water makes it advisable to carry out this control every time you refuel.

Proceed with the engine stopped.

- Place a container under the filter or pre-filter to collect the fluid.
- Unscrew the tap plug (1) in the bottom part of the filter; in some lay-outs the plug includes a sensor to detect the presence of water in the diesel.
- Drain off liquid until only “diesel” can be seen.
- Close the plug again, tightening it completely by hand.
- Dispose of the drained fluids according to current requirements.

**WARNING**

Take care to ensure that the parts are reassembled correctly. Imperfect assembly might result in unfiltered air being sucked into the engine, causing serious damage.
Check/top up electrolyte level in batteries

Place the batteries on a level surface, then proceed as follows.

- Visually check that the fluid level is between the “Min” and “Max” limits; in the absence of references, check that the fluid covers the lead plates inside the elements.
- Top up with distilled water only those elements in which the level is below the minimum.
- Contact specialised technical staff if the battery needs recharging.
- Have the efficiency of the battery recharging system tested if a voltage of less than 11 V (for 12 V rated systems) or 22 V (for 24 V rated systems) is detected with the engine running.
- On this occasion, make sure that the terminals and clamps are clean, properly locked and protected by vaseline.

Some types of battery have a single cover for all the inspection plugs. To access the elements, use a lever as shown in the figure.

CAUTION!

- The batteries contain sulphuric acid, which is extremely caustic and corrosive; always wear protective gloves and goggles when topping them up. Whenever possible it is recommended that this control be carried out by specialised personnel.
- Do not smoke or use live flames near the batteries during the control, and make sure that the room you are working in is adequately ventilated.
**Restore the correct tension in the auxiliary member drive belt**
- Loosen the screw fixing the bracket to the crankcase (1).
- Loosen the counternut (5).
- Loosen the nut (3) fixing the alternator to the support.
- Screw the tensioner (4) until the slot of the fixing bracket (2) is flush with the screw (1) as shown in the figure.
- On reaching the required belt tension, tighten the fixing screw (1), the counternut (5) and the nut (3).

**WARNING**
Replace the belt if any abrasion, cracking or tearing is seen, and if oil or fuel has spilled onto the belt.

**Change oil**
Only proceed with the engine stopped and at a low temperature, so as to avoid the risk of burning.
- Unscrew the oil filler plug (1) located on the tappet cover and extract the engine oil dipstick (2).
- Extract the oil contained in the engine oil sump.
- Fill up through the feeder hole (1) on the timer cover, using the types and amounts of oil indicated in the table REFUELLING.
- Using the dipstick (2), check that the oil level is between the "Min" and "Max" levels.
- Dispose of used oil according to current requirements.
**Change oil filter**

Only proceed with the engine stopped and at a low temperature, so as to avoid the risk of burning.

- Only use filters with a filtration level equivalent to the ones you are replacing (see section FREQUENCY).
- Place a container under the filter support, to collect the used oil.
- Unscrew the filter and remove it (1).
- Carefully clean the surfaces of the support that are in contact with the seal gasket.
- Damp the new seal gasket with a thin layer of oil.
- Hand screw the new filter into place until the seal gasket touches the support, then lock by a further 3/4 of a turn.
- Dispose of the old filter according to current requirements.

**Change fuel filter/s**

Only proceed with the engine stopped and at a low temperature, so as to avoid the risk of burning.

- Only use filters with a filtration level equivalent to the ones you are replacing (see section FREQUENCY).
- Remove the filter/s by unscrewing it.
- Check that the new filter has performance levels that satisfy the needs of the engine (e.g. by comparing them with the old one).
- Damp the new filter seal with diesel or engine oil.
- Hand screw the new filter into place until the seal gasket touches the support, then lock by a further 3/4 of a turn.

**WARNING**

Do not fill up the new filter before it is fitted to the support, to avoid inserting harmful impurities into the injection system and circuit.
Bleeding procedure:

- Loosen the fuel outlet manifold, located on the upper part of the filter (1).
- Make sure that any diesel coming out will not dirty the auxiliary member drive belt or be dispersed into the environment.
- Use the pre-filter hand pump until the diesel coming out is free from any residual air or perform the same operation using the mechanical feed pump (2).
- Lock the manifold loosened as above to the required torque.
- Dispose of any diesel expelled during the above operation in accordance with the law.
- Start the engine and run it at minimum speed for a few minutes to eliminate any residual air.

Note: Should it be necessary to accelerate the bleeding phase, the hand pump can be used during start-up.
Changing the fuel pre-filter

Only proceed with the engine stopped.

- Should the filter be fitted with a sensor to detect the presence of water (3), remove the whole sensor from its seat.
- Remove the pre-filter by unscrewing it.
- Check that the new filter has performance levels that satisfy the needs of the engine (e.g., by comparing them with the old one).
- Damp the new filter seal with diesel or engine oil.
- Hand screw the new filter into place until the seal gasket touches the support, then lock by a further 3/4 of a turn.
- Place the water presence sensor in its seat, taking care to couple the threads correctly.
- Loosen the bleeder screw (2) on the pre-filter support and activate the hand pump (1) until the supply circuit is full. Ensure that any fuel coming out is not dispersed into the environment.
- Lock the bleeder screw tightly.
- Start the engine and run it at idle for a few minutes to eliminate any residual air.

**Note:** Should it be necessary to accelerate the bleeding phase, the hand pump can be used during start-up.

Check exhaust pipe/s for damage

Visually check that the exhaust system is not blocked or damaged.

- Make sure that there is no risk of dangerous fumes within the machine. Contact the Manufacturer if necessary.

Change auxiliary member belt

Please refer to the information provided for checking the belt tension.

Air filter replacement

Refer to the instructions provided for air filter cleaning.
**Change coolant**

Only proceed with the engine stopped and at a low temperature, so as to avoid the risk of burning.

- Provide suitable containers to ensure that no coolant is dispersed into the environment.
- Loosen the seal elements, remove the sleeves connecting the engine circuit to the heat exchanger and wait until it has emptied completely. When empty, repair the circuit making sure that the sleeves are perfectly sealed.
- Fill up the circuit as indicated in the table REFUELLING.
- Refill the engine and the heat exchanger until complete top up.
- With the filler cap open, start the engine and keep it idling for nearly one minute. This phase facilitates the cooling liquid air bleed.
- Stop the engine and top up again.

**MOVING THE ENGINE**

The operations necessary to disconnect and subsequently reconnect the engine must only be carried out by technicians from Service Centres. When lifting the engine only, use the U-bolts indicated in this manual in the section ENGINE TECHNICAL DATA.

Lifting must be carried out using a rocker arm that keeps the metal cables supporting the engine parallel, using all the U-bolts provided simultaneously; the use of a single U-bolt only is not allowed. The engine lifting system must have a capacity and size suited to the weight and dimensions of the engine; check that there is no interference between the lifting system and the engine components. Do not lift the engine before removing the transmission members that are coupled to it.

**DISPOSAL OF WASTE**

The engine is made up of parts and elements that, if discarded, may cause damage to the environment. The materials listed below must be handed over to specialised Collection Centres; the laws in force in the various Countries foresee severe penalties for transgressors:

- Starter batteries.
- Used lubricants.
- Mixtures of water and antifreeze.
- Filters.
- Additional cleaning materials (e.g. greasy or fuel-soaked cloths).
LONG PERIODS OF INACTIVITY

PREPARING THE ENGINE FOR A LONG PERIOD OF INACTIVITY

In order to prevent oxidation of the internal parts of the engine and of certain components in the injection system, when the engine is expected to be inoperative for periods of more than two months, the following operations must be carried out in preparation for this:

1. Drain the lubricant from the sump, after first warming up the engine.
2. Fill the engine with protective oil type 30/M (or alternatively oil that complies with MIL 2160B type 2 specifications), up to the "minimum" level indicated on the dipstick. Start the engine and keep it running for approximately 5 minutes.
3. Drain the fuel from the injection circuit, from the filter and from the injection pump pipes.
4. Connect the fuel circuit to a tank containing CFB (ISO 4113) protective fluid, and feed in the fluid by putting the circuit under pressure and running the engine for approximately 2 minutes, after first disabling the injection system. This operation can be performed by polarising terminal 50 of the starter motor with a positive voltage equivalent to the rated voltage of the system, using a conductor provided for that purpose.
5. Nebulise approximately -- g of 30/M protective oil (10 g per litre displacement) into the turbocharger suction inlet, during the pressurised filling operation described in the previous point.
6. Close all the suction, delivery, ventilation and bleeder openings in the engine with suitable plugs, or seal them with adhesive tape.
7. Drain the residual 30/M protective oil from the sump. This oil can be used again for a further 2 preparation operations.
8. Fit signs reading "ENGINE WITHOUT OIL" to the engine and to the on-board control panel.
9. Drain the coolant, if it has not been mixed with suitable antifreeze and corrosion inhibitors, and affix a sign to indicate the fact.

In the event of prolonged inactivity, the operations described must be repeated every 6 months, following the procedure given below:

A) drain the 30/M protective oil from the sump;
B) repeat the operations described from point 2 to point 7.

Should you intend to protect external parts of the engine, proceed by spraying OVER 19 AR protective liquid on unpainted metal parts, such as the flywheel, pulleys and the like, avoiding belts, connector cables and electrical equipment.
RESTARTING THE ENGINE AFTER A LONG PERIOD OF INACTIVITY

1. Drain the residual 30/M protective oil from the sump.
2. Fill the engine, as prescribed, with lubricant of the type and amount indicated in the table REFUELLING.
3. Drain the CFB protective fluid from the fuel circuit, carrying out this operation as indicated under point 3. of PREPARING THE ENGINE FOR A LONG PERIOD OF INACTIVITY.
4. Remove the plugs and/or seals from the suction, delivery, ventilation and bleeder openings in the engine, restoring it to a normal state of use. Connect the turbocharger suction inlet to the air filter.
5. Connect the fuel circuits to the machine’s fuel tank, completing the operations as indicated in point 4. of PREPARING THE ENGINE FOR A LONG PERIOD OF INACTIVITY. During filling operations, connect the fuel return pipe to a collection tank, so as to prevent any residual CFB protective fluid from flowing into the machine’s fuel tank.
6. Check the engine and fill it up with coolant as prescribed, bleeding it if necessary.
7. Start the engine and keep it running until the idling speed rate has stabilised completely.
8. Check that the instruments on the on-board control panel/s are showing plausible values, and that no alarms are shown.
9. Stop the engine.
10. Remove the "ENGINE WITHOUT OIL" signs from the engine and from the on-board control panel.
**BEHAVIOUR IN AN EMERGENCY**

The user of a machine that has been constructed according to safety regulations, when following the instructions provided in this manual and the indications given on the engine labels, will be working in safe conditions. Should improper conduct result in accidents, always request the intervention of trained first aid specialists immediately.

In an emergency and while awaiting the arrival of first aid specialists, follow the instructions given below.

**Engine malfunctions**

When operating with a malfunctioning engine, take the greatest possible care when manoeuvring and make sure that all those aboard are holding firmly to safe hand-holds.

**In case of fire**

Extinguish the fire using the fire-fighting equipment foreseen, and in the manner indicated by Fire prevention authorities (fire-fighting equipment for certain machines and equipment is compulsory under current safety legislation).

**Burns and scalds**

1. Extinguish any flames on the burned person's clothing, by:
   - throwing water over them;
   - using a powder fire-extinguisher, without directing the jet at the person’s face;
   - covering with blankets or rolling the victim on the ground.

2. Do not attempt to remove pieces of clothing that may have stuck to the skin;
3. In the case of scalding, immediately but carefully remove any clothing that may be soaked in the hot liquid;
4. Cover the burn with a special burn dressing or sterile bandage.

**Carbon monoxide intoxication (CO)**

Carbon monoxide from the engine exhaust is without smell, and is dangerous both because it causes intoxication, and because when combined with air it forms an explosive mixture.

In closed rooms, carbon monoxide is extremely dangerous, as it can reach critical concentrations within a very short time.

When assisting an intoxicated person in a closed room:

1. Ventilate the room immediately, to reduce the concentration of gas.
2. When entering the room, hold your breath, do not light flames, lights or ring electric doorbells or phones, to avoid the risk of explosion.
3. Carry the intoxicated person out into the fresh air or into a well ventilated room, resting him on one side if he is unconscious.
**Electrocution**

**A.** The engine's electrical 12 V or 24 V electrical system does not involve the risk of electrocution, however, in the event of a short-circuit caused, for example, by a metal tool, there is a risk of burning due to overheating of the object through which the electrical current runs. In these circumstances:

1. Remove the object that caused the short-circuit, using means that provide sufficient heat insulation.
2. Switch off the power at the main switch, if there is one.

**B.** The electric generator systems (generator units) normally produce high voltages that are liable to result in extremely dangerous current levels. In the event of medium or high voltage electrocution:

1. Turn off the power supply at the main switch before touching the victim. If this is not possible, use equipment that is both safe and adequately insulated when touching the victim; remember that touching a victim of electrocution is also extremely dangerous for the person giving aid.
2. Proceed as indicated by the competent authorities (cardiac massage, mouth-to-mouth resuscitation, etc.)

**Injuries and fractures**

The vast number of possible circumstances and the specific nature of operations required means that the intervention of a medical team is necessary.

1. In the event of bleeding, keep the edges of the wound pressed together until help arrives.
2. If there is any suspicion of a fracture, do not move the injured part and only move the patient if absolutely necessary.

**Caustic burns**

Caustic skin burns are caused by contact with extremely acid or alkaline substances.

For electric maintenance technicians these are typically caused by acid from batteries; in these circumstances, proceed as follows:

1. Remove any clothing soaked in the caustic substance.
2. Wash the area with lots of running water, avoiding parts that have not been burned.

If either battery acid, lubricants or diesel come into contact with the eyes: wash the eyes with water for at least 20 minutes, keeping the eyelids open so that the water flows over the eyeball (move the eye in all directions to wash more thoroughly).
